

Unpacking machine

Unpacking machine

OPERATING PRINCIPLES

The machine is designed for unpacking packaged or vacuum-packed products. The film or bag is cut on three sides, removed and then ejected, leaving the product completely without its packaging and ensuring an in-line flow, continuous and safe.

It ensures constant production without contaminating the processed products. It lets the operator work in complete safety, without the need to handle blades or knives.

DESIGN SPECIFICATIONS

The machine is made entirely of AISI 304 and Food grade plastic, IP67-rated protection and washable, incorporating the latest design requirements in terms of space and accessibility, safety and cleanliness.

Equipped with a 9" Touch Screen operator control panel. The machine autonomously manages and unpacks every type of product packed with shrink film, cleanly and accurately.
